# GUI to control heating
# 31.8.16
# by Julian Rogers
# heat_control22a - trying to trap more errors!
# error handling now improved
# version has reduced window size to fit on Pi 7" screen
# this version does self-refresh
# need to investigate bug in stat update - done!
# note difference in window size & timeout compared to Windows version
# as data regarding date etc can't be fitted in screen-space available
# temp sensor 2 not yet implemented
